Mail-Filters Announces New Game-Changing “Edge” Messaging Security Product

The global leader in OEM anti-spam & messaging security solutions announces SpamCure Edge a revolutionary new product that runs on a company’s network to stop spam and the viruses and malware they carry before they reach a customer’s mail server.

Redwood City, CA. May 12, 2009. Mail-Filters.com, Inc., the global leader in OEM anti-spam solutions, announced today that it has launched its next-generation messaging security product for eliminating spam, phishing, and malware from email and mobile messaging. Mail-Filters’ SpamCure stops the spam and the malware it carries while the message is still at the edge of your network, before it gets onto your email server reducing network bandwidth and eliminating the need to store and archive bad messages.

“Why even let spam and the viruses and malware they carry to enter the network in the first place?” said Ben Westbrook, president of Mail-Filters. “Our approach to the growing problem of the sheer volume of spam is to eliminate the spam message before it gets to a customer’s server. We can now offer a second solution that accomplishes this. The first was our hosted service SpamRepellent Edge that catches spam “in the cloud”. SpamCure Edge is a product that can run in your network on its own server or on your email server. It can be run as a separate piece of software, or incorporated into your own systems by use of an SDK. When run with Mail-Filters’ Deep Content Inspection these revolutionary new set of technologies has shown in our own tests to be extremely accurate at identifying spam, usually not even allowing 99% of spam to even be accepted. Minute-Zero protection allows the new technology to catch spam and virus outbreaks starting on the very first instance of a malicious message being sent. Those messages that do get through are then subjected to additional multi-step deep content inspection to eliminate almost all the spam. We’ve seen virtually no false positives so far in our testing. ”

New in 2009 the Mail-Filters technology now consists of two groups of spam squashing techniques:

1. EDGE Protection: A multi-step process at the Edge consisting of Reputation Analysis, Connection Scrutiny, Content Pre-inspection and Outbreak Detection. Edge Protection will refuse a message only if it is convinced it's spam by an analysis of the connecting server's recent history and other header information allowing a positive spam, virus, or malware identification. This available as a hosted service (Spam Repellent Edge) or a filter running on the customers' networks (SpamCure Edge).

2. DEEP CONTENT INSPECTION:

- Mail-Filters Bullet Signatures and the SpamCure detection system perform the final inspection on messages that have passed through the edge-based tests
- A community based submission network overseen by Mail-Filters professional spam experts ensures the signatures identifies spam message as soon as they are launched

The result of these processes is a consistent catch rate of more than 99% with less than 1 in 5,000,000 false positives.

ABOUT MAIL-FILTERS™
